

Stakeholder Briefing — Capstone Incident

Summary: On 18 August 2025 a simulated security incident affected a lab VM. The SOC detected exploitation attempts against a Samba service and quickly isolated the VM. The attacker IP (192.168.1.102) was blocked and containment actions prevented lateral movement. No production data was impacted during this exercise. Actions Taken: VM isolated, attacker IP blocked, forensic artifacts collected, and Tier 2 investigators engaged. Next Steps: Patch exposed services, enforce MFA, and review network segmentation. A detailed report with timelines and recommendations has been delivered to IT leadership. This briefing is intended to inform executives; technical details are available in the full report.
